

Turmrechnen

Introduction

In this exercise you have to implement a tool for the mathematical exercise *Turmrechnen* with Angular.

Requirements

- The exercise has to be implemented with *Angular*
- Create two input fields for the parameter of the *Turm*
- Create a button with which the calculation can be started.
- Display all steps of the *Turm* as shown in the following screenshot:

Start Value:

Height:

$10 * 2 = 20$

$20 * 3 = 60$

$60 * 4 = 240$

$240 * 5 = 1200$

$1200 / 2 = 600$

$600 / 3 = 200$

$200 / 4 = 50$

$50 / 5 = 10$

- If the parameter *height* is < 2 , display an error message in red as shown in the following screenshot:

Start Value:

Height: Height must be ≥ 2
